The aim of EBVs is to allow buyers to see how much of an animal's performance is due to its breeding (genetics) and how much has been influenced by the environment that they have been kept in – management, feeding, farm location, housing etc

An animal will pass on half of its genetic merit to its offspring.

e.g., if Ram A has a Scan Weight EBV of +3.33 then his progeny at scanning will be over 1.5kg heavier than average

Inbreeding within the national pedigree Texel flock

Use the Mating Predictor Tool now on iTexel

Members are encouraged to use the mating predictor on iTexel to manage levels of inbreeding within their flocks. You cannot assess ewe/ram combinations by eye. The Mating Predictor estimates the inbreeding value of the offspring from a particular pairing.

The predictor is available on your smart phone as well as desktop

To check the ram(s) you're interested in purchasing and see how they combine with your ewes:

1. Login to iTexel, click Mating Predictor
2. Choose 'New Combination' to select a Sire and Ewes
3. Click 'View Results'
4. A summary will appear with the number in brackets displaying the predicted inbreeding coefficient. A coefficient below 7 is desirable

Inbreeding can be defined as the mating of related individuals, or of individuals with shared ancestors. A balance needs to be maintained between selecting animals to optimise rates of genetic gain and minimise levels of inbreeding.

Increasing levels of inbreeding can result in inbreeding depression, where performance can suffer. It can be argued that any animal is only one mating away from being outbred.

Each animal's inbreeding coefficient value is now displayed in the sales catalogue. The lower the level of inbreeding the better; a value of 7% or below is regarded as an acceptable level of inbreeding within a breeding programme.
